

In the Specification:

Please replace previously amended paragraph **[0025]** with the following amended paragraph **[0025]**:

[0025] The frame 14 is provided on its rear end on each side with an open-bottomed housing 72, that is connected, particularly welded, above the spherical bearings 26 to the outside of the frame 14. The housing 72, that is open downward and aligned vertically with the seat 66, is used to engage the spring 68. On the rear side of the housing 72 and in vertical alignment with the peg 70, a peg 70' of identical configuration is attached. A bracket 71 ~~73~~, ~~not~~ shown only on the left-hand side in FIG. 4, with two bores, whose spacing corresponds to the spacing of the pegs 70 and 70', when the suspension 20 is loaded, can be provided, as shown, engaged with the pegs 70 and 70', so that a relative movement between the arm 34 and the console 44 cannot take place or can do so only to a limited degree if one of the peg-receiving bores is configured as a slot.
